Documentation

Functional Requirements

- FR001 A clerk will be able to create an account for a customer using customer's ID.
- FR002 A customer will be able to pre-fill a registration form online and then, visiting a bank, a clerk will be able to finish the account creation using the form.
- FR003 Only when creating an account a customer will be able to choose a type of the account (current or saving account), account currency (CZK or EUR).
- FR004 A timer will be periodically (at the end of the month) computing fees and interests for the past month.
- FR005 A clerk will be able to set a money transfer after a customer's request.
- FR006 A customer can set a money transfer using a online interface (internet banking).
- FR007 Every online money transfer must be authorized by a code which will be sent to the user's cell phone via SMS
- FR008 Every transaction code is valid for 5 minutes
- FR009 Transaction is canceled if wrong code is submitted 3 times
- FR010 A client can view his/her transfer history using the internet banking.
- FR011 Card payments at shops or online will be processed by the external system.
- FR012 Money in cash can be deposited or withdrawn in person at the bank's cash desk, served by bank cashier.
- FR013 Money in cash can be withdrawn from an ATM using a card.
- FR014 Card can be delivered to a customer by post (including authorization PIN sent separately) or he/she can pick it up at the bank.
- FR015 The card can be only activated by a clerk or through an ATM.
- FR016 Card has a validity date. After the date the card will be invalidated.
- FR017 Card can be blocked by a customer through online banking.
- FR018 A clerk can unblock a card that is blocked.
- FR019 Bank managers can view system statistics.
- FR020 Bank managers can change system parameters.
- FR021 Technicians can maintain the system and change user settings.

Non-Functional Requirements

- NFR001 Every ATM has a working connection to the bank server.
- NFR002 SMS authorization code will be sent in less than 30s after request.
- NFR003 Card activation and lock/unlock has to take effect in less than a minute after request.
- NFR004 A transaction details must be available for up to 10 years after transaction.
- NFR005 There must be a redundant copy of every server and connection element.
- NFR006 In case of hardware failure, system must switch to the redundant copy in less than 30s.
- NFR007 Every bank employee is authenticated using a USB token and a password.
- NFR008 Creating a new account can take up to 24h.
- NFR009 All system preferences and user data changes has to be saved as separate revisions in case of rollback.
- NFR010 An internal money transfer has to be completed in less than a day. A money transfer to any other bank has to be completed in less than a week.

Textual Analysis

Textual Analysis1

Registration and new **account**: Both the **registration** of a new **customer** and opening of a new **account** can follow two scenarios. First, a **customer** can register/open an **account** in person at the bank with the help of a **bank assistant**. Second, the **registration/account** opening can consist of an online pre-**registration** and **registration** finalization in person at the bank (again with the help of a **bank assistant**), where he/she signs the documents and presents his **personal ID**. For simplicity, let each **account** be assigned to exactly one person.

Account types: The bank offers "checking" accounts and "savings" accounts, which have different **interest rates** and withdrawal conditions. Both **types** of accounts can have either CZK or EUR **currency**. The **account** type cannot be changed after **account** opening.

Fees: At the beginning of each month the system is periodically computing the fees for **account** management and **interest rates** for the past month. The computation is based on the **priority** of the **customer**, which is derived from how long the **customer** has been with the bank, and what has been the **balance** on his/her accounts in the past year.

Non-cash money transfer: Money transfer can be done in the bank with the help of a **bank assistant** or through Internet banking (from a browser), where the **customer** can also see the **transaction** history on his/her accounts. To start a transfer, the **customer** first needs to enter necessary information (**bank account** of the **receiver**, **amount**, etc.) and then the **customer** needs to authorize the **transaction** by entering an **authorization code** sent to his/her mobile phone. The **authorization code** can be entered at most three times

(each time within 5 minutes from its delivery). If the code is entered three times unsuccessfully (wrong code or entered late), the whole **transaction** is canceled and the reserved money (for the **transaction**) is unblocked.

Non-cash payments: **Card** payments in shops or online and their evidence are realized by means of the integration of the banking system with an **external application** that is responsible for these activities.

Cash: Money in cash can be deposited or withdrawn in person at the bank's cash desk, served by bank **cashiers**. Money from checking accounts can be withdrawn also from **ATM** with a **card**. Each "checking" **account** is assigned one **card**, there is no **card** for a "savings" **account**.

Card: An interesting object in the system is the **card**, which goes through the following life cycle. The **card** can be delivered to the bank **customer** either by post (with authorization **PIN** number sent separately) or in person at the bank (based on his/her preference). At the beginning, the **card** is **inactive**. The **card** can be activated by the **customer** either at the bank with the help of a **bank assistant**, or through an **ATM**. Then the **card** is **valid** till the **validity date**, when it is discarded. When **valid**, the **card** can be **blocked** to protect the **account** against attack if the **card** is lost or stolen - and then again unblocked at the bank. The **card** is **blocked** also in an **ATM** if the authorization **PIN** code is entered unsuccessfully three times.

Users: Besides bank assistants, **cashiers** and bank customers, the banking system is accessed also by bank managers (each bank branch has its own **manager**, one of which is the **manager** of the whole bank), who can access various statistics about money flows, including future predictions, and can set various system parameters (**interest rates** of savings accounts, fees, etc.). The last type of users are the **technicians**, who take care of the system and when

asked by the managers, they change the **access rights** of other users (e.g. when a cashier is promoted to a **manager** position).
